Exercise 1

Proof. $1/4(||x+y||^2 - ||x-y||^2) = 1/4(\langle x+y, x+y \rangle - \langle x-y, x-y \rangle) = 1/4(2\langle x, y \rangle + 2\langle x, y \rangle) = \langle x, y \rangle \quad \square$

Proof. $1/2(||x+y||^2 + ||x-y||^2) = 1/2(2\langle x, x \rangle + 2\langle y, y \rangle) = \langle x, x \rangle + \langle y, y \rangle \quad \square$

Exercise 2

$1/4(||x+y||^2 - ||x-y||^2 + i||x-iy||^2 - i||x+iy||^2) = 1/4(\langle x+y, x+y \rangle - \langle x-y, x-y \rangle + i\langle x-iy, x-iy \rangle - i\langle x+iy, x+iy \rangle)$

Consider,

$$\begin{aligned} i(\langle x+iy, x+iy \rangle - \langle x-iy, x-iy \rangle) &= i(\langle x, x \rangle + \langle x, iy \rangle + \langle iy, x \rangle + \langle iy, iy \rangle - \langle x, x \rangle + \langle x, iy \rangle + \langle iy, x \rangle - \langle iy, iy \rangle) \\ &= -2 - \langle x, y \rangle + \overline{\langle x, y \rangle} \\ &\implies 4\langle x, y \rangle \end{aligned}$$

Exercise 3

1. $\cos \theta = \frac{\langle x, x^5 \rangle}{||x^5|| ||x||} = \frac{1/7}{\sqrt{1/33}} \implies 35^\circ$
2. $\cos \theta = \frac{\langle x^2, x^4 \rangle}{||x^2|| ||x^4||} = \frac{1/7}{\sqrt{1/45}} \implies 16^\circ$

Exercise 8

1. $\langle S_i, S_j \rangle = \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$
2. $||t|| = \sqrt{\langle t, t \rangle} = \sqrt{\frac{1}{\pi} \int t^2} = 0$
3. $\text{proj}_x \cos(3t) = \langle x, \cos(3t) \rangle = 0$
4. $\text{proj}_x \cos(3t) = 2\sin(t) - \sin(2t)$

Exercise 9

$$A = \begin{bmatrix} \cos \theta & -\sin \theta \\ \sin \theta & \cos \theta \end{bmatrix} \text{ Then, } \langle a_i, a_j \rangle = \begin{bmatrix} \frac{1}{\pi}(\frac{x}{2} + \frac{1}{4}\sin(2x))|_{-\pi}^{\pi} & -\frac{1}{\pi}(\frac{1}{2}\cos^2(x))|_{-\pi}^{\pi} \\ \frac{1}{\pi}(\frac{1}{2}\cos^2(x))|_{-\pi}^{\pi} & \frac{1}{\pi}(\frac{x}{2} + \frac{1}{4}\sin(2x))|_{-\pi}^{\pi} \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$$

Exercise 10

- If a matrix is orthonormal then it represents an orthonormal transformation, then $Q : \mathbb{F}^n \rightarrow \mathbb{F}^n$ preserves the inner product implies $|Q| = 1$ or -1 implies $Q^H = Q^{-1}$.
 $\leftarrow QQ^H = I \implies Q^H = Q^{-1} \implies |Q^H| = 1 \text{ or } -1$ which implies that the lin transformation defined by Q preserves the inner product.
- Notice from the above proof we have $|Q| = 1 \text{ or } -1 \implies \|Qx\| = \|x\|$.
- Again from (1) we see that $QQ^H \implies Q^H = Q^{-1} \implies Q^{-1H} = Q \implies Q^{-1H}Q = I$.
- Since $Q^{-1} = Q^H$ we have that the columns are lin independent (from existence), then since $\langle Q, Q \rangle = \delta_{ij} = \sum_j q_{ij}q_{kj}$ thus we have an orthonormal basis.
- The first part follows directly from (1). But this is not iff, $\begin{bmatrix} 1 & x \\ 0 & 1 \end{bmatrix}$.
- $Q_1^H Q_1 Q_2^H Q_2 = I \implies Q_1 Q_2 (Q_1 Q_2)^H = I$

Exercise 11

You get 0.

Exercise 16

- Simply consider D to be a diagonal matrix with negative entries, then the decomposition is not unique.
- Suppose by

Exercise 17

Proof.

$$\begin{aligned}
 A^H A x &= A^H b \\
 (QR)^H A R x &= (QR)^H b \\
 R^H Q^H Q R x &= R^H Q^H b \\
 R^H R x &= R^H Q^H b \\
 R x &= Q^H b
 \end{aligned}$$

□

Exercise 23

$$|x| + |y - x| \geq |x + y - x| = |y| \implies |y - x| \geq |y| - |x|$$

$$|y| + |x - y| \geq |y + x - y| = |x| \implies |y - x| \geq |x| - |y|$$

But then since $|y - x| = |x - y|$ we get $|x - y| \geq ||x| - |y|| \implies ||x - y|| \geq ||x| - |y||$

Exercise 24

1. $|f(t)| \geq 0$ implies positivity. $\int |\alpha f(t)| = |\alpha| \int |f(t)|$. $\|f + g\| = \int |f(t) + g(t)| \leq \int |f(t)| + \int |g(t)|$
2. Positivity follows from the previous part. $\|\alpha f\| = (\int_a^b |\alpha f(t)|^2 dt)^{1/2} = (|\alpha|^2 \int |f(t)|^2)^{1/2} = |\alpha| (\int |f(t)|^2)^{1/2}$. $\|f + g\|^2 = \int |f(t) + g(t)|^2 = \int |f(t)|^2 + 2|f(t)g(t)| + |g(t)|^2 \leq \|f\|^2 + 2\|f\|\|g\| + \|g\|^2 = (\|f\| + \|g\|)^2$
3. Again, positivity follows from the previous parts. $\|\alpha f\| = |\alpha| \sup |f|$. And, $\sup |f + g| = \sup |f(x) + g(x)| \leq \sup (|f| + |g|) = \|f\| + \|g\|$.

Exercise 26

Clearly, $m\|x\|_a \leq M\|x\|_a$, $1/M\|x\|_a \leq \|x\|_b \leq 1/m\|x\|_b$ and $m\|x\|_b \leq \|x\|_c \leq M\|x\|_b \implies \|x\|_a \sim \|x\|_b$. Thus it is an equivalence relation.

Exercise 28

1.

$$\|Ax\|_2 \leq \|Ax\|_1 \leq \sqrt{n}\|Ax\|_2$$

$$\|A\|_1 \geq \frac{\|Ax\|_1}{\|x\|_1} \geq \frac{\|Ax\|_2}{\sqrt{n}\|x\|_2} \implies \frac{1}{\sqrt{n}}\|A\|_2 \leq \|A\|_1 \leq \|A\|_2$$

2. Note we have $\|A\|_2 \geq \frac{\|Ax\|_2}{\|x\|_2} \geq \frac{\|Ax\|_\infty}{\sqrt{n}\|x\|_\infty} \implies \|A\|_2 \geq \frac{1}{\sqrt{n}}\|A\|_\infty \implies \frac{1}{\sqrt{n}}\|A\|_\infty \leq \|A\|_2 \leq \|A\|_\infty$

Exercise 29

Take Q to be orthonormal. Then, $\|Q\| = 1$, then if A is orthonormal we have equality since $\|R_x\| = \|x\| \implies \|Ax\| = \|A\|\|x\| = \|x\|$.

Exercise 30

Positivity, since $\|\cdot\|$ is a norm with positivity the change of basis in the inside will not affect this. The same statement holds for scale preservation as $\|\alpha A\| = \|\alpha S^{-1}AS\| = \alpha\|A\|_S$. Finally, triangle ineq:

$$\|A + B\|_s = \|S^{-1}(A + B)S\| \leq \|S^{-1}AS\| + \|S^{-1}BS\|$$

. Similarly we have by Cauchy-Schwartz that $\|S^{-1}ABS\| \leq \|A_S\| \|B_S\| \implies \|\cdot\|$ is a matrix norm.

Exercise 37

Take p such that $p = ax^2 + bx + c$ then $L(p) = p'(1) = 2a + b \implies q = (2, 1, 0)$.

Exercise 38

$$D = \begin{bmatrix} 0 & 0 & 0 \\ 2 & 0 & 0 \\ 0 & 1 & 0 \end{bmatrix} \quad D^H = \begin{bmatrix} 0 & 2 & 0 \\ 0 & 0 & 1 \\ 0 & 0 & 0 \end{bmatrix}$$

Exercise 39

1. $\langle S + T(v), w \rangle = \langle Sv, w \rangle + \langle Tv, w \rangle \implies (S + T)^* = S^* + T^*$ and $\langle \alpha Tv, w \rangle = \alpha \langle v, Tw \rangle \implies (\alpha T)^* = \alpha T^*$
2. $\langle S^*(w), v \rangle = \overline{\langle S(v), w \rangle} = \langle w, Sv \rangle$
3. $\langle STv, w \rangle = \langle Tv, S^*w \rangle = \langle v, T^*S^*w \rangle = \langle v, (T^*S^*)w \rangle$
4. $T(T^*)^{-1} = I \implies (T^*)^{-1} = (T^{-1})^*$

Exercise 40

Given Frobenius inner product:

1. $\langle A, B \rangle = \langle \text{tr}(A^H B), \rangle = \langle A^H B, \rangle$
2. $\langle A_2, A_3 A_1 \rangle = \text{tr}(A_2 A_1^H A_3) \implies \langle A_2, A_3 A_1 \rangle = \langle A_2 A_1^*, A_3 \rangle$
3. If we combine both parts and note we have a linear operator we get $(T_A)^* = T_A$.

Exercise 44

Consider $Ax = b$ has a solution \hat{x} . Then, $y \in \mathcal{N}(A^H) \implies \langle y, b \rangle = 0$ since $\langle A^H y, x \rangle = \langle 0, x \rangle = 0 \implies A^H y = 0$. Then by contradiction assume we do not have a solution. Then, $\langle b, b \rangle = 0$ but then $x = 0$ so we must have a solution.

Exercise 45

Take A from the skew and B from the sym. And consider them with the forebenous inner product such that $\langle A, B \rangle = \langle -A, B \rangle = \text{tr}(AB)$. Now notice that $\langle A + A^T, B \rangle = \langle A, B \rangle = \text{tr}(A^T B) = 0$. Also $\text{tr}(AB) + \text{tr}(AB) = 0$ so, $A^T = -A \implies A \in \text{skew}_n(\mathbb{R}) \implies \text{skew}(\mathbb{R})^\perp = \text{skew}(\mathbb{R})$

Exercise 46

1. $A^H Ax = 0 = A^H(Ax) \implies Ax \in \text{null space.}$
2. $\langle Ax, Ax \rangle = x^H A^H Ax = 0 \implies \|Ax\| = 0 \implies Ax = 0$
3. $A^H A = A \implies A, A^H A$ have same rank. From previous part.
4. Since $A^H A$ is square we only need tot have linearly independent cols to be nonsingular, since this is assumed we have the result.

Exercise 47

$$P = A(A^H A)^{-1} A^H \implies \text{rk}(P) = \text{rk}(A(A^H A)^{-1} A^H) \implies \text{rk}(P) = n \text{ since } \text{tr}(P) = \text{tr}(I).$$

Exercise 48

1. $P(xA + yB) = \frac{x(A+A^T)}{2} + \frac{y(B+B^T)}{2} = xP(A) + yP(B).$
2. $P^2(A) = \frac{A+A^T}{2} = P(A)$
3. $\langle A, P(A) \rangle = \langle P^* A, A \rangle = \text{tr}(A^T P^*(A)) = \langle A, P^*(A) \rangle$
4. $P(A)A = \frac{A+A^T}{2} A = \frac{AA - A^T A}{2} = 0$
5. $P(A) = \frac{A+A^T}{2} = \frac{2A}{2} = A \implies A^T = A.$
6. $\|A - P(A)\|^2 = \frac{\text{tr}(A^T A) - \text{tr}(A^2)}{2} \implies \sqrt{\frac{\text{tr}(A^T A) - \text{tr}(A^2)}{2}}$

Exercise 50

$$A = [1 \dots 1, X_1^2, \dots X_n^2]^T, x = [1/s, -r/s]^T, b = [y_1^2, \dots, y_n^2]$$
